

Algorithm:

1. index.html:

- Define the `index.html` file with the necessary HTML tags and structure.
- Include the required meta tags, CSS, and JavaScript libraries.
- Create a navigation bar with links to different pages.
- Add a jumbotron element to display a welcome message.
- Create three columns to showcase hours, specials, and delivery information.
- Include a carousel to display images of the restaurant.
- Add a card element with a featured menu button.

2. menu.html:

- Define the `menu.html` file with the necessary HTML tags and structure.
- Include the required meta tags and CSS.
- Create a navigation bar with links to different pages.
- Display images and descriptions of the menu items.
- List the specials with their details.

3. page.html:

- Define the `page.html` file with the necessary HTML tags and structure.
- Include the required meta tags and CSS.
- Create a navigation bar with links to different pages.
- Add a pagination section to display page links.

4.order.html:

- Define the `order.html` file with the necessary HTML tags and structure.
- Include the required meta tags and CSS.
- Create a navigation bar with links to different pages.
- Add a form for placing an order, including fields for name, order selection, and special requests.
- Handle the form submission event and display an alert message with the order details.

5. form.html:

- Define the `form.html` file with the necessary HTML tags and structure.
- Include the required meta tags and CSS.
- Create a navigation bar with links to different pages.

- Add a form for contacting the restaurant, including fields for name, email, and message.
- Handle the form submission event and display a success message or handle any error.
